Bent knees in profile-some quick notes (Rustcity)

Preview:
Some quick drawings + helpful thoughts on how to draw bent knees

Synonyms: knees; legs; lower body

Some notes on the notes:

- There is a subtle dip, right above the knee, where the muscle ends. The more muscle a person has, the more pronounced this dip will be. Try and feel it on yourself!

- When you bend your knee the knee itself is lower than you would think. The "front" of a bent knee is actually where the femur ends. (This page isn't really about bones so I uh ,,, did not draw them very accurately here)
